A, Molecule type: mRNA

A, Molecule type: mRNA

A, Cross to the bear and part as family of guanine nucleotide-binding proteins that relay

A, Cross to the bear and gamma chains, required for GTPase activity, appear to be common to all-

ains. The beta and gamma chains, required for GTPase activity, appear to be common to all-

rase; it is specific for each type of G protein.

C, Superfamily: GTP-binding regulatory protein Gs alpha chain

C, Reywords: alternative splicing; blocked amino end; GTP binding; heterotrimer; lipoprote

C, Reywords: alternative splicing; blocked amino end; GTP binding; heterotrimer; lipoprote

F, 379/FRegion: nucleotide-binding motif A (P-loop)

F, 77-280/Region: GTP-binding MKN motif

F, Modified site: myristylated amino end (Gly) (in mature form) #status predicted

F, 381 Binding site: palmitate (Cys) (covalent) #status predicted

F, 186/Modified site: ADP-ribosylarginine (Arg) (by cholera toxin) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          - Agrobacterium tumefaciens (strain C58, Dupont)

New polynucleotide encoding a prostate-specific protein, for diagnosing, monitoring and treating prostate cancer in a patient and for use in vaccines.

Claim 2; Page 399; 543pp; English.

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated real prepared using (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and construct the detection of cancer in a patient. (I) and construct in also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides for antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific peptide of the invention. The peptides either represent

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polynucleotides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704P, P712P, P774P and 8305D are located in a genomic region on chromosome 22411.2 known as the Cat Eye Syndrome region. Prostate specific antigen (PSA) P501S was located on chromosome 1. AAMB4671 to AAMB5143 and AAG99000 to AAG99077 represent polynucleotide. and polypeptide sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prostate specific protein and its encoding polynucleotide, useful for the treatment and diagnosis of prostate cancer.
                                                                                                                                                                   Prostate cancer; vaccine; gene therapy; cytostatic; fusion protein; immunogen; cancer; prostate specific antigen; PSA; prostatic acid phosphatase; PAP; prostate specific membrane antigen; PSMA.

                    The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                              Human prostate protein P503S epitope mapping peptide #2102.
                                                                                                                                                                        100.0%; Score 116; DB 6; 100.0%; Pred. No. 3.9e-10;

```
The invention relates to an isolated polypeptide comprising no more than 11-542 amino acids of ADB1353 comprising a sequence ADB1487. The peptides comprise a fragment ADB13563 of that contain naturally processed T-cell epitopes for 3 class I major histocompatibility complex (MEC) alleles. ADB13563 is a polypeptide encoded by a human prostate specific cDNA, one of 648 disclosed as new. Also included are nuclaic acids encoding the proteins and peptides, expression vectors, a host cell cDNA, one of 648 disclosed as new. Also included are nuclaic acids encoding the proteins and peptides, expression vectors, a host cell transformed with the vector, an isolated antibody (or antigen binding content that binding agent that binds to the protein or peptide, detecting the presence of a cancer that binds to the protein or peptide, detecting the agent and comparing the amount of polypeptide or a polypeptide or a peptide or a polypeptide or a peptide or a tumour protein comprising contacting a patient comprising the peptides or proteins, stimulating or expanding T cells of peptides or the isolated T cell population, treating prostate cancer in a patient and treating prostate cancer in a patient with the peptides or compounds, determining the presence of a cancer in a patient with the peptides or ontiferate, and administering the protiferated T cells proliferate, and administering the presence of cancer in a patient. The peptides for an oligonucleotide that hybridises to nucleic acid encoding them), is used to detect the presence of antigen-presenting cells expressing the nucleic acid, are used to stimulate or expand T cells specific for a tumour protein. The peptides, uncleic acids, antibodies, fusion proteins, T cell populations or antigen presenting cells are used to stimulate or expand T cells specific for a tumour protein. The peptides of the prostate cancer in a patient. The present sequence of a

New polynucleotides encoding prostate specific polypeptides isolated from a human prostate tumor cDNA library are useful to diagnose and treat cancer particularly prostate cancer.

Example 18; SEQ ID NO 505; 99pp; English.

The invention relates to human prostate-specific polypeptides and the polynucleotides encoding them. The invention also relates to an isolated antibody or its antigen-binding fragment that specifically binds a polypeptide of the invention, a method of detecting cancer in a patient that binds a prostate-specific polypeptide and comparing the amount of bound polypeptide compared to a predetermined cut-off value and a fusion protein comprising a prostate-specific polypeptide. The sequences of the invention are used to diagnose and treat cancer, particularly prostate cancer. This sequence represents a human prostate-specific polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.html.

New human receptors and membrane-associated proteins (REMAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant REMAP expression e.g. cancer, AIDS, atherosclerosis, or infections.

Claim 1; SEQ ID NO 19; 298pp; English.

The invention relates to a novel isolated polypeptide comprising a human receptor and membrane-associated protein (REMAP). The polypeptide of the invention demonstrates cytostatic, antiarteriosclerotic, anticonvulsant, notropic, neuroprotective, cerebroprotective, and i-HIV, antiallergic, antiinflammatory and thyromimetic activities and may be useful for treating and diagnosing various disorders including those which are cell proliferative such as cancer and atherosclerosis, neurological including particularly HUMISTON's disease and stroke, immune/inflammatory particularly AIDS and allergies and developmental such as hypothyroidism and Cubhing's syndrome, as well as infections. The current sequence is that of the human REMAP protein of the invention.

Sequence 174 AA;

```
The invention relates to novel isolated nucleic acid molecules and comprise a nucleic acid sequence encoding any of the 167 amino acid comprise a nucleic acid sequence encoding any of the 167 amino acid comprise a nucleic acid sequence encoding any of the 167 amino acid sequences (e.g. 438, 237 or 233 amino acids) fully defined in the comprises and the specification (SEQ. ID NOS: ADP81055 to ADP81261) and comprises any of the 128 nucleotide sequences (e.g. 4798, 1494 or 1691 bp) fully defined the specification (SEQ. ID NOS: ADP80055 to ADP81094). The invention further comprises: a method for determining the presence of a ovarian specific nucleic acid molecule; a host cell comprising the vector comprising the above nucleic acid molecule; a polypeptide encoded by the nucleic acid molecule cited above; an antibody or jet fragment that specifically binds to the above polypeptide; a method for determining the presence of an ovarian specific protein in a method for determining the presence of an ovarian specific protein in a cample; a method for determining the presence of an ovarian specific acid molecule or polypeptide; a method of treating a patient, the kit comprising a means for concern in a patient, the kit comprising a means for polypeptide; a method of treating a patient with ovarian cancer; and a polypeptide or in a patient with ovarian cancer; and a concern and polypeptides may be used to create a cytostatic activity. The isolated polypeptides may be used to create a concern in the solated polypeptides may be used to create a cancer and treating ovarian cancer. This sequence represents the protein cancer and treating ovarian cancer. This sequence represents the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New ovarian specific nucleic acid molecules and polypeptides useful for diagnosing, preventing or treating ovarian cancer, for producing transgenic animals or cells, or for research purposes.
                                                                                                                                                                                                                                                                     normal; neoplastic; ovarian; ovarian specific nucleic acid; OSNA; metastatic; cancer; vaccine; cytostatic; human.
                                                                                                                                                                                                                                 Protein of human ovarian specific gene, SEQ ID No 157.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chen H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 12; SEQ ID NO 157; 754pp; English.

This invention describes novel cytoscatic polymuciectice and polypeptiue sequences which can be used in a method for diagnosing prostatic cancer. Diagnosis is based on or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular short balow 8000, preferably 300, that binds to the polympetide; an aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisocope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, cheween normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that cobstatic cancer patients, or subjects at risk, were incubated

                          biotinylated second antibody, streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the polymucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Specht T;

      weight below 5000, preferably 300, that binds to the polypeptide; an aptemer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide, a (monoclonal) antibody (Ab) against the polypeptide, preferably humanised or human; an anti-idiotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polynucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, concer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that correct as upreglated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated corrected and them diaminobenzialin-conjugated horseradish contextained with hemalum (blue). Malignant cells stained surongly but non-malignant cells only weakly. In 15 of 63 samples of strongly but non-malignant cells only weakly. In 15 of 63 samples of cadenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastasses were also stained. ADR65805-ADR66954 represent the invantion
                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoalboulin Rc portion (e.g. AAV3418) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 70 novel genes and their fragments (nucleic acid sequences AAV34164-V34276; amino acid sequences AAW35657-W7519) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be disagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the polymucleotides, based on which tissues they are most highly expressed in (see AAV34154 for described uses). (Updated on 25-MAR-2003 to correct Pf field.)

Fischer CL, Soppet DR, Carter KC; 18 GA, Yu G, Ni J, Peng P, Young PE, Greene JM; Hu J, Florence KA, Olsen HS, Ebner R, Brewer LA; Rosen CA, R, Endress ( 'DR, bire-aM, Duan R, Perrie AM, Ruben SM, **3ednarik** Shi Y;

WPI; 2003-466138/44. N-PSDB; ACD08028. Novel isolated human secreted HODAZ50 polypeptide useful for diagnosing or treating deficiencies or disorders of the immune system, autoimmune disorders, hyperproliferative disorders, and infectious diseases.

Claim 11; Page 173; 243pp; English.

The invention describes an isolated human secreted HODAZ50 polypeptide (I) comprising a sequence at least 95% identical to a sequence selected from polypeptide fragment of any one of the 123 polypeptide sequences

WPI; 2001-328324/34.

Polypeptide comprising part of the Wilms Tumor gene product sequence is used in the diagnosis and treatment of malignant diseases e.g. leukemia and cancer associated with WTI.

Disclosure; Page 223-224; 228pp; English.

The present invention describes compositions comprising peptides derived from the Wilm's tumour protein WT1 and methods for their use in treating malignant diseases. Peptides derived from both the murine and human WT1 proteins are provided. The human WT1 gene is found on chromosome 11p13, and the protein was shown to be a zinc finger transcription factor. The immunogenic Deptides of the invention are particularly useful in the diagnosis and treatment of cancer and leukaemia. The present sequence is a polypeptide described in the exemplification of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

env polyprotein precursor - equine infectious anemia virus (strain CL22)

N.Alternate names: coat polyprotein

N.Alternate names: coat protein gp45; coat protein gp90

C.Species: equine infectious anemia virus

A.Note: host Equus caballus (domestic horse)

C.Accession: C41991

C.Accession: C41991

C.Accession: C41991

Notatines: coat protein gp45; coat protein gp30

NiContains: coat protein gp45; coat protein gp30

C.Species: equine infectious anemia virus

NiContains: coat protein gp45; coat protein gp30

C.Species: equine infectious anemia virus

A.Note: host Equus caballus (domestic horse)

C.Date: 31-Mar-1991 #sequence_revision 31-Mar-1991 #text_change 09-Jul-2004
